Safety Program Assists Troy Utilities

This year, Troy's municipal utility renewed its participation in the Indiana Municipal Power Agency's (IMPA) Safety Training Program for utilities to prioritize staff training and education for its employees. IMPA is the community's not-for-profit, wholesale power provider, and through its operations and engineering subsidiary IMPA Service Corp, the organization offers a variety of additional services beyond power supply to assist its members. Local utility staff and leaders attended several training sessions hosted by the program through 2022, and the effectiveness of each course led them to seek renewal for the current year. As with all IMPA Service Corp programs, the Safety Training Program seeks to provide training opportunities—particularly in the area of job safety—to IMPA member utilities at a cost-effective rate.

The Safety Program is offered monthly to IMPA member communities, with participating communities given the option to select which months they would like to participate, and if they would prefer to have the training onsite or travel to a nearby community for sessions. This flexibility allows Troy's utility to take advantage of the program in a way that is customized to meet

IMPA Responds to Winter Storm Elliott

From December 22 to the 26 of 2022, Winter Storm Elliott swept across North America, causing record low temperatures and severe winter conditions throughout the United States. Snowfall, ice, and blizzard-like conditions blew through much of the Midwest while hazardous road conditions kept many of us hunkered down inside through the holidays. During these days of sub-zero temperatures, approximately 1.5 million utility customers throughout the country lost power (according to www.poweroutage.us).

Fortunately, Indiana utility customers were only a small portion of those without power, and the Indiana Municipal Power Agency (IMPA) worked diligently with neighboring utilities and the state's Regional Transmission Organizations to ensure the reliability of the power grid. IMPA's seven combustion turbines—totaling 249 megawatts (MW) of capacity in Anderson, Indiana, and Richmond, Indiana—were staffed and operational through the winter storm. The Anderson and Richmond units are run by IMPA employees who worked day and night through December's winter storm to ensure power was delivered to utility customers. These units,

which primarily run on natural gas and are built to operate in temperatures down to -20 degrees Fahrenheit, are a vital dispatchable resource in extreme weather events due to their capability to utilize ultra-low sulfur No. 2 fuel oil as a backup. The backup fuel allowed the units to run and provide power during the whole severe winter weather event.

Other staff members who were out in the field during the cold weather event included IMPA Service Corp's linemen and operations employees who responded to outages in member communities. During Winter Storm Elliott, IMPA Service Corp's crews responded to eight IMPA member communities to assist with power restoration to keep utility customers warm in their homes.

IMPA is grateful to the dedicated staff members who braved the historic winter conditions to ensure the rest of us could remain safe and warm at home. The Agency's reliability, whether during a typical day or an extreme period of uncertainty, is its upmost priority. Now, as we head toward the warmer weather of spring, IMPA looks forward to continuing its legacy of reliable operations and excellent electric service for all member communities. •

How Does Reliable Electricity Reach Me?

Your power is unique as it is distributed not by a for-profit electric utility, but rather by your municipally-owned, locally controlled electric utility. Your municipal electric utility—also known as a “public power” utility—receives its power from the Indiana Municipal Power Agency, a not-for-profit organization created by 61 public power utilities in the Midwest. This is where your electricity begins!

STEP 1

IMPA is the wholesale power provider to your community, meaning that it produces or purchases electricity (depending on what is most economically advantageous) and transmits that energy to your local utility. IMPA’s power supply portfolio is made up of coal, natural gas, solar, wind, and nuclear energy. By providing its member communities with power from multiple sources, IMPA can maintain stable costs.

STEP 2

Once the power is generated, no matter from which type of resource, a set of equipment located within a substation is used to “step up” the electricity’s voltage. A higher voltage means that the electricity can travel longer distances over high-voltage transmission lines with lower energy losses.

STEP 3

Once “stepped-up,” the electricity is sent along transmission lines, allowing it to reach IMPA’s member communities. IMPA jointly owns a portion of the state’s transmission system, which covers about 2/3 of Indiana.

STEP 4

Once the electricity reaches a community like yours, it is “stepped down” by a local substation, bringing the power to a lower voltage that will allow it to travel on your local community’s distribution power lines.

STEP 5

The power then travels along local distribution lines owned by your public power utility to reach homes and businesses in the community.

Tidbits & Trivia

The **Indiana Municipal Power Agency** (IMPA) is a not-for-profit organization that provides a low-cost, reliable, and environmentally-responsible power supply to its members. IMPA provides this wholesale power to 61 communities in Indiana and Ohio, who collectively make up the Agency's membership.

Question: What is one benefit of driving an electric vehicle rather than a gas-powered car?

the town's specific needs. As with many IMPA programs, participating utilities are also able to share in the costs of sessions, allowing the price per community to collectively drop as the number of members involved in an individual session rises. Troy has taken advantage of this offering, joining with nearby Tell City Electric Department crews at their facility for sessions of the program.

IMPA Service Corp developed the Safety Program with the Tennessee Valley Public Power Association, a non-profit training and service organization that works with municipal electric utilities. These professional courses are hosted by IMPA at various locations throughout the state of Indiana. For example, Tell City hosted a "Work Zone Safety" session that Troy staff attended in May as a part of the program, welcoming TVPPA's instructor to its

own facility to educate local staff. In the same month, TVPPA provided the same session elsewhere in the IMPA member communities of Anderson, Centerville, Greenfield, and other towns.

Research continues to show that workers who engage in ongoing training throughout their career typically perform better at their job. With IMPA Service Corp's Safety Program, Troy employees are empowered to

ensure that they are providing an effective and safe service to utility customers in the community. The efforts of the utility's staff to further educate themselves demonstrates their enthusiasm for offering great customer service and ensuring that you have access to safe and reliable electricity each and every day.

For more information about IMPA Service Corp, visit www.impa.com/about-imp.

What's the Word?

Gas Turbine Plant

noun

A facility which uses natural gas or other liquid fuels to power a combustion turbine and generate electricity. The first true gas turbine was patented in 1791!

IMPA owns seven combustion turbines and associated facilities totaling 419 MW in the aggregate. These include three units in Anderson, IN, two near Richmond, IN, and two in Indianapolis, IN. IMPA employees operate and maintain the combustion turbines located in Anderson and Richmond, while the plant in Indianapolis is operated and maintained under a contract with a separate utility that has two other units at the same facility.

Cooking Corner

Broccoli Casserole

Recipe submitted by Kimberly of Paoli, Indiana

- 2 lbs broccoli, frozen or cooked
- 1 roll ritz crackers, crumbled
- 1/2 lb velveeta, cubed
- 1 stick butter divided in half

Cook broccoli according to package directions. Add velveeta and 1/2 stick butter. Cook until melted. Butter a 2 qt casserole dish. Pour broccoli into casserole dish. Pour crumbled crackers on top. Melt remaining 1/2 stick butter and pour on crackers. Bake on 350 degrees for 30 minutes and enjoy!

White Mountain Salad

Recipe submitted by Jean of Middletown, Indiana

- 1 small can crushed pineapple (in juice)
- 1 can chopped pecans
- 1/4 cup lemon juice
- 1 eight oz tub cool whip (thawed)
- 1 can Eagle brand milk

In a large bowl, stir all ingredients together. Cover and refrigerate for 2 hours.

“When I take this recipe to a dinner, I always get several requests for the recipe!” - Jean

How Do I Save Energy in Hot Weather?

Last year, we asked *Municipal Power News* readers, “What are some of the methods you use to reduce your energy consumption in hot weather?” Here’s what Kenneth had to say!

“Our answer at home is to close the drapes, blinds, and try to cook with the air fryer, microwave, or outside on the grill instead of using the stove or oven on the really hot days. We’ve already purchased new thermo sliding glass doors with blinds and low-e ratings. We’ve also spray-foamed the basement

walls and the underside of the roof. For a 1964 house, we feel pretty efficient.

At work, we try to close the blinds and raise the thermostat a degree or two. We also bought two digital smart thermostats and replaced the old mercury bulb sliders.”

-Kenneth E

That’s a great answer, full of energy efficiency tips! Below are a few other ways you and your family can save on energy this summer.

Energy Efficiency Tip #1

Use fans around your home to circulate cool air. Set ceiling fans to turn counter clockwise, as this will push air down and create a cooler feeling in the room.

Energy Efficiency Tip #2

Replace air filters in your home with each season. Dirty air filters can cause your system to work harder and longer, using unnecessary energy as a result.

Energy Efficiency Tip #3

Keep lamps and TV sets away from your thermostat. Thermostats can sense the heat that these items give off, which can cause the A/C to run longer than required.
