Solar Park Coming to Community

Construction on an IMPA solar park will begin early next year to bring renewable energy to electric customers in Fountain County. While County leaders are excited to see the 1.35-megawatt facility come to fruition, some residents and business owners may be curious as to how this will affect the local community. Read further for answers to some frequently asked questions that have to do with your town's upcoming solar park.

Who owns the solar park being constructed near Veedersburg?

The solar park will be owned by the Indiana Municipal Power Agency (IMPA). IMPA is a not-for-profit organization that provides wholesale electric power to municipal utilities in Indiana and Ohio—including Veedersburg. Each IMPA member community holds a seat on the IMPA Board of Commissioners and has input into all decisions made by the Agency. In this way, Veedersburg has a direct stake in the solar park, and each solar park constructed by the Agency. The cost of the construction and maintenance of the property is paid for by IMPA.

Will having a solar park located in the County lower my electric bill?

Since IMPA is the owner of the solar park, the generation asset will be factored into

Saving Energy in Cold Weather

Read the various ways that readers of this newsletter save energy in the cold.

Winter Safety with IMPA!

The winter season is upon us, and while it is the least favorite time of year for many, preparing for the cold can help things go over a bit more smoothly. Use this time to remind yourself and your loved ones about the following safety tips that will help everyone enjoy the time to come as best as they can.

Driving

- Drive slowly and attentively in icy or snowy conditions. Give yourself plenty of time to get to your destination.
- Keep your vehicle's gas tank as full as possible throughout the winter season. This can prevent your fuel lines from freezing, which can result in your car not starting.
- Dress warmly and keep an extra set of clothes and blankets in the car.
- Avoid using backroads, as major streets and highways will have better clearance in bad conditions.

Avoiding Fires

- Never plug a space heater into an extension cord or power strip - only plug them directly into an outlet.
- Never leave a space heater, lit fireplace, or candles unattended for long periods of time.
- Portable generators can be great during a winter power outage, but keep in mind that they pose fire and carbon monoxide poisoning risks. Never run a generator indoors or in enclosed areas, and keep fuel containers away from heating devices.

Snow Removal

- Before going outside to clear snow from a driveway or walkway, be sure to stretch just like you would before regular exercise.
- When shoveling snow, be sure to stay hydrated and avoid overexertion. Take frequent breaks to let your body rest, as cold weather can put a unique strain on your heart and lungs.
- Keep dry while working outside with snow. Wet clothes will make your body lose heat faster.

How Does Public Power Work?

The transmission lines stretching across the country carry electricity to households and businesses nationwide. However, some of the electricity travels to customers served by investor-owned utilities (IOUs) or rural electric cooperatives (REMCs), while other households like yours are served by a public power utility. Your community, as a member of the Indiana Municipal Power Agency (IMPA), buys its electricity from the Agency before selling it to you and bringing it to your door. The electricity that your community purchases is called wholesale power—it is supplied to your local public power utility for resale to retail customers of the utility. By purchasing wholesale power in bulk, the member utilities of IMPA are able to provide electricity with the economic advantages than if they were to individually generate the power themselves or purchase it elsewhere. Your community takes advantage of this benefit, since all 61 member communities of IMPA work together to purchase power in bulk through the Agency.

Member utilities of IMPA have contracts with the Agency to ensure that all the electric needs of the community are met. IMPA, by either generating power at a

generation facility or purchasing it from other utilities, places the power on the electric grid through transmission lines.

The high voltage electricity travels across the grid on these transmission lines to your community. Before the electricity gets to your residence, a substation transformer is used to lower the voltage of the electricity to make it safer to travel across shorter distances than the transmission lines cover. This lower voltage also makes it safer for the electricity to be in closer proximity to traffic and people. Once electricity goes through the transformer in the substation, it moves through distribution lines in your local community to a transformer at homes and businesses. It then arrives at your home and allows you to turn on the lights, heat your home, and watch tv.

Public power utilities are not just there to provide power – they work for the betterment of the community, too. These utilities are embedded in the fabric of their communities—boosting community investment, supporting local education, and getting involved with beautification and charitable programs. As a result, public power customers benefit from affordable energy, better service, local control, and a utility that cares about the overall well-being and growth of your community. •

At IMPA Board Meetings, a representative from your community helps guide the direction and decisions of the Agency.

Tidbits & Trivia

The **Indiana Municipal Power Agency** (IMPA) is a not-for-profit organization that provides a low-cost, reliable, and environmentally-responsible power supply to its members. IMPA provides this wholesale power to 61 communities in Indiana and Ohio, who collectively make up the Agency's membership.

What are some of the benefits of public power?

Send your answer to newsletter@impa.com, along with your name, e-mail address, and address for a chance to win an energy efficiency prize pack!

the Agency's power supply portfolio. These generation assets are what produce the electricity that is provided to IMPA member communities like Veedersburg.

The construction of this solar park, and the other parks planned in IMPA communities, is meant to further diversify IMPA's portfolio of power supply resources, adding additional renewable energy as the Agency prepares for the possibility of future, more restrictive, federal or state requirements. IMPA's solar projects add stable-cost power generation and are blended with the Agency's other resources. Through this initiative and others, IMPA strives to keep its electric rates among the lowest in Indiana. Therefore, Veedersburg can remain a competitive utility provider.

As a result, the upcoming solar park will have no direct impact on your electric bill, but it will contribute to long-term rate stability.

So, what are the benefits of having a solar park in Veedersburg?

1. Local utility infrastructure gets the benefit of system improvements at no direct cost.

With IMPA constructing a solar park to connect to the County's electric infrastructure, the

Agency works to improve the local system to accommodate the new generation facility. This provides some system upgrades to the region's utility in preparation for the commissioning of the solar park.

2. IMPA's solar assets contribute to rate stability. All of the energy generated at the upcoming solar park will be consumed by electric users in the area. Logistical costs come with transporting power from one place to another, so with the solar park in Fountain County, the cost of transportation is decreased for a portion of IMPA's power supply. Lower costs for IMPA translate to lower costs for all 61 of its member communities, including Veedersburg.

Additionally, diversity in fuel-source and geographic location lets IMPA avoid the problem of "putting all its eggs in one basket." If complications arise with one resource or generating location, IMPA is prepared to continue supplying power from other resources. In this way, IMPA-constructed solar parks play a role in ensuring stable electric rates and reliable power for years to come.

Lastly, wisely investing in local solar units and resource diversity prepares the Agency and its members to persevere no matter the political or economic climate. This means that IMPA will be able to continue providing Veedersburg with low-cost, reliable, and environmentally-

What's the Word?

Investigating Power Terminology

Distribution Lines

Utilities use distribution lines to transport electricity from the larger transmission system to individual customer homes and businesses. While transmission lines carry electricity across long distances at a high

voltage, distribution lines carry electricity over shorter distances at a lower voltage. You may see transmission lines while driving on a highway, but the utility lines you see on the streets of your community are distribution lines.

Distribution lines bring electricity to its final stage of delivery. As a member of a public power utility, your town or city owns and operates the distribution lines in your community.

or
newsletter@impa.com

- 2 large eggs
- $\frac{3}{4}$ cup skim milk
- $\frac{1}{4}$ cup orange juice
- 1 $\frac{3}{4}$ cups eggnog
- $\frac{1}{2}$ cup canola oil
- 1 tbsp grated orange zest
- 4 $\frac{3}{4}$ cups all-purpose flour
- $\frac{3}{4}$ cup sugar
- 2 tbsp baking powder
- $\frac{1}{2}$ tsp salt
- 1 tsp ground cinnamon
- 1 tsp ground nutmeg
- $\frac{3}{4}$ cup dried cranberries
- $\frac{3}{4}$ cup chopped macadamia nuts

Preheat oven to 350°F. Whisk wet ingredients together with orange zest in a bowl. In another bowl, combine all dry ingredients except for cranberries and macadamia nuts. Add the liquid mixture to the dry mixture, carefully stirring until the flour is moistened. Fold in cranberries and nuts. Grease and flour 2 loaf pans and pour in batter. Bake for 50-60 minutes, or until a toothpick inserted comes out clean. Cool in pans for 10 minutes, then remove wire racks to cool completely. Slice and serve with orange marmalade. Or, to serve without a spread, use the glaze below.

In a small bowl, mix:

- 1 tbsp eggnog
- $\frac{3}{8}$ cup confectioner's sugar

Drizzle mixture over the cooled loaves

How Do I Save Energy in Cold Weather?

Last year, we asked readers of the *Municipal Power News* some of the methods they use to reduce energy consumption in cold weather. Here is what some of you said!

“I have reduced my energy consumption due to my purchase of long cloth door tubes that resemble snakes. They are the draft prevention cloth tubes approximately 36” x 3 1/2” filled with beans or double tubes with center strips. They can be placed in the home at the bottom of outside doors or where drafts enter under doors inside a home. The double tube style can slide under

the storm door outside the house door---one tube outside the storm door and the other tube set between the storm door and the inside house door. These can also be used on doors in cold rooms with closed doors to stop drafts. This is really great in blocking cold air at the floor level that cause cold feet and drafts.”

- Jean

“I often use an infrared/radiant space heater that is thermostat-controlled. During the day I close off unused rooms so my living room/kitchenette is comfortably warm. The glow of the radiant heater is pleasing like a fireplace. You definitely need to wear insulated slippers or plush socks indoors in

addition to layered clothing. Wearing indoor weather-appropriate clothing, I can keep my heater set on a lower temperature—generally less than 65 degrees. My furnace, in comparison, needs to be set at 70+ degrees to maintain satisfactory room warmth.”

- Penny

“During the cold weather months, the most effective method for reducing my energy consumption is by closing off rooms that do not necessarily have to be heated all day. I also put plastic on any drafty windows and use draft stoppers for my doors. I’ve replaced

most of my home’s light bulbs with energy efficient LED bulbs and I change my furnace filter often. Room darkening curtains help keep the heat in and as the famous saying goes, I never let the water run!”

- Tiffany

“The method that I use most is to wear warmer clothes in the house. I know that there are people who want to sit around the house in shorts and t-shirts, and run around the house in bare feet, all the while having

their thermostat turned way up. That makes no sense to me. Today, for instance, it’s 14° outside. The thermostat is set at 68° inside. I’m wearing a flannel shirt with a puffy vest, long pants, and shoes.”

responsible power into the foreseeable future.

3. Improves the region's marketability for economic development.

Renewable generation facilities serve to bolster economic development in local communities, as local renewable power is highly desirable to prospective businesses and industries. As a result, the solar park plays an important role in attracting potential opportunities and jobs to the town.

4. Contributes to the local tax base.

Since IMPA purchased and now owns the property that the IMPA solar park will be located on and has invested in the assets that comprise the solar park, the Agency is now a contributor to area's tax base. Through annual property taxes paid by IMPA that come with this ownership and construction on the site, the upcoming Solar Park is expected to contribute hundreds of thousands of dollars in property taxes to the community in the decades to come. •
